The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TV in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestration, bacterial overgrowth, whipple's diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangictasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal disease, eosinophille gastroenteritis, and immune diseases, e.g. systemic lupus erythematosus or food allergies, primarily to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              zonulin; antagonist; zonula occludens toxin receptor; blood-brain barrier; antiinflammatory; cerebroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      which bind to a zonula occludens tox
physiologically modulate the opening

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical

                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc physiologically modulate the opening of mammalian tight junctions (70). The peptide antagonists are based on a common motif of 207 cc and human zonulins, which is believed to be critical for receptor bluding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal cantinflammation, where they bind to the 207 receptor in the intestine cand yet does not physiologically modulate the opening of TJ in the cintestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficile infection, concertainty infection, e.g. clostridium difficile infection, concertainty shigellosis, viral gastroenteritis, parasite concertainty and conjunt of the collegenous colitis, inflammatory bowel disease, diseases with colligenous colitis, inflammatory bowel disease, diseases with correction of congenital heart disease with frontan's operation, concertain disease, essimplical correction of congenital intestinal lymphangiectasia, collidated disease, without ulceration, e.g. Menetrics's disease, collides seventherity to the college of the colling activation and immune disease, collides, evidential intestinal and immune disease, colling active partylematics and immune disease, and immune disease, and immune disease, colling active partylematics and contentity to the colling active partylematics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with conlargenous colitis, inflammatory bowel disease, diseases marked by the content of the c

                                                                                                                                                                                                                                                                                                                                                                                                                                                             binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antapoints are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiactasia, correction of congenital heart disease with Fontan's operation, a mucosal diseases with beart disease with Fontan's operation.

The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by near recombinant DNA techniques.
                                                                                                                                                                                                                                                                                                                                                                                                              mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune disee.g. systemic lupus erythematosus or food allergies, primarily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK4-A. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV.

                                                                                                                                                                                                                                           cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nuclectides long) and 14 shorter clones were isolated by PCR amplification, including clone JK4-C. Primer/probes derived from th sequences of these clones can be used in diagnostic assays for HCV. See Q40425-Q40439.

This sequence represents murine tyrosine phosphatase MPTP-delta. The CDNA sequence encoding this protein was isolated from murine brain tissue and was cloned, for expression, into the downstream region of collatathione-S-transferase sequence and expressed as a fusion protein in E. coli. MPTP-delta proteins regulate differentiation and activation of cells. This sequence can be used in the elucidation of the molecular mechanism for information transmission in cells, regulation mechanisms in the nervous system or immune system, or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tyrosine phosphatase MPTP-delta; murine; brain tissue; glutathione-S-transferase; fusion protein; E. coll; differentiation; activation; information transmission; nervous system; immune system;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This present sequence is that of a peptide antagonist of zonulin (20), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antinflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, and constraints, shigellosis, viral gastroenteritts, parasite infestation, bacterial overgrowth, whippe's disease, diseases with
                                                                                                                                                                                                                                                                                                                                                   Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                              and human zonulins, which is believed to be critical for receptor:

Chinding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, wiral gastroenteritis, parasite infestation, becterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangictasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, e.g. coeliac disease, eosiophilic gastroenterities, and immune disease, coeliac disease, eosiophilic gastroenterities, and immune disease,

The peptide antigonists are used as an antinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection,
                                                                                                                                                                                                                                                                                                            mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune disce.g. systemic lupus erythematosus or food allergies, primarily
                                                                                                                                                                                                                                                                                                                                                                enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor and property. They can be prepared by chemical synthesis or by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       blood-brain barrier; antiinflammatory; cerebroprotective; neuroprotective; dermatological; antiulcer; antiviral; antibacterial; cytostatic; anti-HIV; vulnerary; antiallergic; hypotensive; immunosuppressive; antiparasitic; vasotropic;

It can be produced in host cells utilising a novel cDNA clone (T61291). The full-length and truncated beta-3 integrin subunits can be used in assays to identify novel cpds. which inhibit the bone absorption process, esp.in osteoporosis.

                                        The full-length mouse vitronectin integrin receptor beta-3 subunit (W13573) can be produced in host cells utilising a novel CDNA clone (T61290) isolated from a mouse osteoclast cDNA library. The beta-3 integrin, and a novel truncated beta-3 integrin (see also W13573), can be used to screen for cpds. that bind full-length or truncated beta-3 integrin, esp. for inhibiting the bone resorption process in osteoporosis, and in an improved assay for identifying potential inhibitors of human alpha-v beta-3 receptors (i.e. inhibitors of osteoclast formation).

412-CEROL KINASE 2 (EC 2.7.1.30) (ATP:GLYCEROL 3-PHOSPHOTRANSFERASE 2)
(GLYCEROKINASE 2) (GK 2).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- CATALVTIC ACTIVITY: ATP + GLYCEROL - ADP + GLYCEROL 3-PHOSPHATE.
-!- PATHWAY: RATE-LIMITING STEP IN GLYCEROL UTILIZATION.
-!- SIMILARITY: BELONGS TO THE FUCOKINASE / GLUCONOKINASE /
GLYCEROKINASE / XYLUKKINASE FAMILY.
-!- CAUTION: A STOP CODON IN POSITION 483 WAS TRANSLATED AS TRP TO RESTORE THE SIMILARITY WITH THE C-TERMINAL REGION OF OTHERS GLPK HOMOLOGS.

C., Carrett C., Lander E.S., Krumlauf R., Hattersley A.T., Ellard S., Turnpenny P.D.; Lander E.S., Krumlauf R., Hattersley A.T., Ellard S., Turnpenny P.D.; "Mutations in the human delta homologue, DLL3, cause axial skeletal defects in spondylocostal dysostosis.",

Nat. Genet. 24:438-441(2000).

-I- FUNCTION: INHIBITS PRIMARY NEUROGENESIS. MAY BE REQUIRED TO DIVERT NEURONS ALONG A SPECIFIC DIFFERENTIATION PATHWAY. PLAY A ROLE IN THE FORMATION OF SOMITE BOUNDARIES DURING SEGMENTATION OF THE
             -1- SUBUNIT: DNA POLYMERASE ALPHA-PRIMASE IS A FOUR SUBUNIT ENZYME (SUBUNITS A, B., C AND D), WHICH IS ASSEMBLED THROUGHOUT THE CELL CYCLE. THE LARGEST SUBUNIT (SUBUNIT A) HAS DNA POLYMERASE ACTIVITY, THE TWO SMALLEST SUBUNITS (SUBUNITS C AND D) HAVE DNA PRIMASE ACTIVITY, SUBUNIT B BINDS TO SUBUNIT A. - SUBCELLULAR LOCATION: NUCLEAR. - - FURL PHOSPHORYLATED IN A CELL CYCLE-DEPENDENT MANNER, IN G2/M PHASE (BY SIMILARITY). - - SIMILARITY: BELONGS TO THE DNA POLYMERASE ALPHA SUBUNIT B FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PARAXIAL MESODERM (BY SIMILARITY).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor. Uniding. They can be prepared by chemical synthesis or by use of antinflammatory agents. The peptide antagonists are used as an antinflammatory agents in the treatment of gastrointestinal antisetine. Gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine increased intestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite minestino, bacterial lovergrowth, whipple's disease, diseases with

                                                                                                                                                                                   This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy
                                                                   New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                           caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whitple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, e.g. systemic lupus erythematosus or food allergies, primarily to milk.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

physiologically modulate the opening of mammalian tight junctions and human zonulias, which is believed to a common motif of 20T and human zonulias, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an atinifiammatory agents. In the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TJ in the increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, e.g. clostridium difficile infection, caused by infection, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous collitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lympham, mesentic tuberculosis, and after surgical moreral disease with Fontan's ordered heart disease with formatory and after surgical correction of congenital heart disease with Fontan's ordered disease marked by correction of congental heart disease with Fontan's ordered in mesented tuberculosis, and after surgical moreral disease with formatory and after surgical disease with formatory and after s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide antagonist of zonulin useful as antiinflammatory agent for
                                                                                                                                                                                                                             It may be responsible for diarrhoea in some strains of cholera and the 20T gene or fragments of it are deleted from strains of vibrio-cholerae (V.c.) to be used as vaccines. These V.c. strains have 100% efficacy in protecting humans against subsequent infection with a strain of a similar serotype and avoid undesirable side effects such as diarrhoea, nausea and cramping. Cultures of these strains may be used for prodn. of vaccines against cholera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                          The amino acid sequence is that of the zonula occludens toxin (20T)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (20T) receptor, yet do not

                  This present sequence is that of a peptide antagonist of zonulin (27), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT combinant zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an tinflammation, where they bind to the ZOT receptor in the intestina inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the case of the starointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal permeability and the peptide is useful for caused by infection, e.g. clostridum difficile infection, e.g. congenital intestinal lymphaniectasia, lymphatic obstruction, e.g. congenital intestinal lymphaniectasia, mescenteric tuberculosis, and affers surgical correction of congenital heart disease, and immune disease, conformation, e.g. wenetrier's disease, eccinosis and interview or inferience or reformation, e.g. meinteritis, and immune diseases.

(2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (7J). The peptide antagonists are based on a common motif of 207 and human zonulins, which is believed to be critical for receptor in formation. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the 207 receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, micestation, bacterial overgrowth, whipple's disease, diseases with micosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous collits, inflammatory bowel disease, disease marked by
New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    coeliac disease, eosinophilic gastroentéritis, and immune diseases, e.g. systemic lupus erythematosus or food allergies, primarily to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                        This present sequence is that of a peptide antagonist of zonulin (27), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the and yet does not physiologically modulate the opening of TJ in the and yet does not physiologically modulate the opening of TJ in the cased intestinal permeability and the peptide is useful for intestine. Gastrointestinal inflammation conditions give rise to increased intestinal conditions that cause protein losing enteropathy enterotion, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, parasiste infection, bacterial overgrowth, whipple's disease, diseases marked by impatic obstruction, e.g. coopenital intestinal lymphaniectasia, sarcoidosis lymphanie mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal disease, eosinophilic gastroenteritis, and immune disease, ceg, e.g. systemic lupus erythematosus or food allergies, primarily to
                                                                               New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis -

This present sequence is that of a peptide antagonist of zonulin (12), one of 25 such peptides (see Y79105-29) of the invention, which blud to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of Zon and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the Zon receptor in the intestine and yet does not physiologically modulate the opening of TJ in the cansed intestinal enflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, caused by infection, e.g. Clostridium difficile infection, mocosal erosion or ulcerations, e.g. quastritis, gastric cancer, collagenous collits, inflammatory bowel disease, diseases marked by impatic obstruction, e.g. congenital intestinal lymphanictasia, arreading interation, asserted to congenital intestinal lymphanictasia, arreading interaction, asserted to congenital intestinal lymphanictal arreading arreading interaction, asserted tuberculosis, and after surgical correction of congenital heart disease with Fontant of congenital heart disease diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mucosal diseases without ulceration, e.g. Menetrier's disease, coellac disease, eosinophilic gastroenteritis, and immune diseases, e.g. systemic lupus erythematosus or food allergies, primarily to

The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor in they can be prepared by chemical synthesis or by use of recombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the ZOT receptor in the intestine antinflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the increased intestinal permeability and the peptide is useful for creating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficibe infection, caused by infection, e.g. clostridium difficibe infection, caused by infection, e.g. clostridium difficibe infection, cancer, infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous collitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoldosis lymphan, mesenteric tuberculosis, and after surgical correction of congenital heart disease, disease, disease, disease, coslinghilic gastroenteritis, and immune disease, coslinghilic gastroenteritis, and immune disease, e.g. systemic lupus erythematosus or food allergies, primarily to

The present sequence is the sequence of a human secreted protein. Its CDNA was isolated from an adult brain cDNA ilbrary. The proteins and coding sequences of the invention can be used in the isolation of similar genes and proteins, in the elucidation of their function in vivo, and to treat a number of conditions. It is possible that they may have uses as nutritional supplements, as cytokine or cell proliferation factors, in immune modulation, where they may be used to treat immune and autoimmune diseases, as haematopoiesis regulators (treating myeloid or lymphoid cell deficiencies), in the promotion of tissue growth, they may have chemokine or chemotactic activity, haemostatic or thrombolytic activity, or anti-inflammatory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                   New secreted proteins and polynucleotides encoding them, which are derived from Homo sapiens, useful for therapy, diagnosis, and research, as well as nutritional sources or supplements -

                                                                                                                                                                                                                                                                                                                                                                     The present invention is concerned with a number of secreted proteins and their coding sequences isolated from various human cDNA libraries. The proteins and coding sequences can be used in the isolation of similar genes and proteins, in the elucidation of their function in vivo, and to treat a number of conditions. It is possible that they may have uses as immurfathonal supplements, as cytckine or cell proliferation factors, in immune modulation, where they may be used to treat immune and autoimmune diseases, as haematopoissis regulators (treating myeloid or lymphoid cell deficiencies), in the promotion of tissue growth, they may have chemokine or chemotractic activity, haemostatic or thrombolytic activity, or anti-inflammatory activity, No information about sequences B23632-B23645 is given in the specification.
                                                                                                                                                                                                                                                                                                     New secreted proteins and polynucleotides encoding them, which are derived from Homo sapiens, useful for therapy, diagnosis, and research, as well as nutritional sources or supplements
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Y36754-Y37949 are encoded by open reading frames (ORF9) of the genome of Chlamydia trachomatis (see 201455). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genttal diseases such as nongonococcal uretritis, epidymitis, cervicitis, salphngitis, perlhepatitis, bartholnitis; puemopathy in breast feeding infants; and veneraal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rhotekin; Rho effector; Chromosome 2; target; GTP-activated Rho protein; susceptibility locus; Parkinson's disease; cytostatic; cardiant; primer; vaccine; probe; treat; cancer; cardiovascular disorder; brain disorder; developmental disorder; cytoskeletal-associated disorder; variant; EST; expressed sequence tag; signal transduction related disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                              The present amino acid sequence is the human Rhotekin variant protein, a putative target for Rho. It is derived from an EST and has close homology to Rhotekin polypeptide. It is a member of the Rho effector protein family and is located on chromosome 2, that has a susceptibility locus for Parkinson's disease. Rhotekin protein binds specifically to GTP-activated Rho proteins and interacts with downstream components of Rho-dependent signalling pathways. It has cytostatic and cardiant activity. This sequence may be used to identify agonists, antagonists or inhibitors and detect diseases associated with Rhotekin. The DNA sequence is useful as a source of primers and probes, while the proteins may be used as vaccines. Rhotekin sequences are used to treat diseases, such as acmore, cardiovascular diseases, brain disorders, developmental calated diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention discloses a new polynucleotide, the polypeptide coded by the polynucleotide and the process for preparing the polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            has active Rho protein-binding activity and inhibits activity of Rho protein GYPase. Rhotekin is useful as an inhibitor of tumour formation and metastasis (e.g. by gene therapy using the CDNA coding sequence). Rhotekin is also used in a competitive assay for screening for inhibitors of the Rhotekin-Rho binding interaction or it can be used for the elucidation of the mechanism of platelet aggregation and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
